The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA6943 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention
The present invention describes composition of matter (I) comprising an Fc domain, pharmacologically active peptides, and linkers. Where (I) is: (X1)a-[1-(X2)b, where: F1 = an Fc domain; X1 and X2 = act) independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1-(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modified peptide; mimetic; Fc domain; fusion; immunoglobulin G; erythropoletin; TPO; tumour necrosis factor alpha inhibitor; TNF-alpha inhibitor; interleukin 1 antagonist; IL-1 antagonist; TPO mimetic peptide; EPO mimetic peptide; EMP; VEGF antagonist;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 7
                                                                                                                                             Novel vehicle-peptide molecule or its multimers useful for treating inflammatory and autoimmune diseases, cancer, rheumatoid arthritis,

Additionally, (I) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer, rheumatoid arthritis, diabetic retinopathy, obesity, sleep disorders, infertility, and neurological degenerative diseases. (I), comprising EPO-mimetic compounds are useful for treating disorders characterised by low red blood cell levels such as anaemia. The TPO-mimetic comprising compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency, such as thrombocytopaenia, aplastic anaemia, metastatic tumour which result in thrombocytopaenia, aystemic lupus erythematosus, and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777 represent amino acid and nucleic acid sequences used in the

(I) can be used as a therapeutic or CC prophylactic agent as well as for screening purposes. (I) is useful for CC diagnosing diseases characterised by dysfunction of their associated CC protein of interest, for identifying normal or abnormal proteins of CC interest, as a part of diagnostic kit to detect the presence of their CC proteins of interest in a biological sample. Additionally, (I) is useful CC for treating inflammatory and autoimmune diseases, tumour growth, cancer, CC infertility, and neurological degenerative diseases. (I) comprising EPO-CC mimetic compounds are useful for treating disorders characterised by low cred blood cell levels such as anaemia. The TPO-mimetic compounds are useful for treating conditions that involve an existing CC megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency, such as thrombocytopaenia, aplastic anaemia, metastatic tumour which result in thrombocytopaenia, systemic lupus erythematosus, and Fanconi's syndrome. ABB72403 to ABB73426 and ABL35695 to ABL35777 crepresent amino acid and nucleic acid sequences used in the

Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human c mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is an SH3 antagonist peptide sequence used to make a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

This invention relates to novel mammalian CDR mimetibodies, specific portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which theelf comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products
                                                                                                                                                                                                                                                                                                                                                  New CDR mimetibody comprising a portion of a heavy or light chain variable region comprising human framework or ligand binding region, useful for preparing a composition for treating e.g., immune, cardiovascular or neurologic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SH3 antagonist peptide sequence SeqID

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        char can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/ or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is an SH3 antagonist peptide sequence used to make a mimetibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hypotensive; neuroprotective; nootropic; antibacterial; virucide; fungicide; gene therapy; immune disorder; cardiovascular disease; arrhythmia; hypertension; heart failure; neurodegenerative; multiple sclerosis; dementia; Albeimer's disease; anaemia;
which encode them), compositions, methods and uses. The invention may be useful for the development of compounds with an immunosuppressive, cardiovascular, cardiant, hypotensive, neuroprotective, nootropic, antibacterial, virucide or fungicide activity. In addition, the disclose sequences may prove useful for gene therapy. The CH1-deleted mimetibody is useful for diagnosing or treating a disease condition in a cell, tissue, organ or animal, specifically for modulating, treating, alleviating, preventing the incidence or reducing the symptoms of an immune, cardiovascular (for example arrhythmia, hypertension or heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 7

                     This invention relates to CH1 deleted mimetibodies (and the DNA sequences which encode them), compositions, methods and uses. The invention may be useful for the development of compounds with an immunosuppressive, cardiovascular, cardiant, hypotensive, neuroprotective, nootropic, antibacterial, virucide or fungicide activity. In addition, the disclosed sequences may prove useful for gene therapy. The CH1-deleted mimetibody is useful for diagnosing or treating a disease condition in a cell, tissue, organ or animal, specifically for modulating, treating, tissue, organ or animal, specifically for modulating, treating, alleviating, preventing the incidence or reducing the symptoms of an immune, cardiovascular (for example arrhythmia, hypertension or heart failure), or neurodegenerative (for example multiple sclerosis, dementia or Alzheimer's disease) diseases or disorders, anaemia, cancerous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                failure), or neurodegenerative (LVL CONTERED AND ADDRESS) or Alzhaimer's disease) diseases or disorders, anaemia, cancerous or Alzhaimer's diseases (for example bacterial, viral or conditions, or infectious diseases (for example bacterial, viral or fungal infection). The present sequence is that of a peptide which may fungal infection). The present sequence is that of a peptide which may read during the creation of a mimetibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                     Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New CH1-deleted mimetibody polypeptides and nucleic acids, useful modulating, treating, alleviating, preventing an immune, cardiovas or neurodegenerative disease or disorder, anemia, cancer, or infec

antiinflammatory, neurole respiratory-Gen activity

This invention relates to CH1 deleted mimetibodies (and the DNA sequences which encode them), compositions, methods and uses. The invention may be useful for the development of compounds with an osteopathic, cardiovascular-Gen, dermatological-Gen, auditory, endocrine-Gen, gastrointestinal-Gen, gynaecological-Gen, hepatotropic, haemostatic, immunomodulator, antiallergic, muscular-Gen, cytostatic,

Gen, gymaecological-Gen, hepatotropic, antiallergic, muscular-Gen, cytostatic neuroleptic, ophthalmological, nephro

cytostatic,

nephrotropic

Claim 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC AAW05414 and AAW05415 represent variants of the Src Src-homology region 3 CC (SH3) domain-binding peptide termed pSrcCII (see AAW05412). These CC sequences were used to probe human cDNA libraries to identify human SH3 CC domain containing proteins (such as AAW05401), that can be used in the CC method of the invention. The method of the invention is for identifying CC polypeptides containing functional domains of interest (especially SH3 CC domains). It comprises contacting a multivalent recognition unit (RU) CC complex with a number of peptides and identifying polypeptides having a CC selective binding affinity for the RU complex. The method is based on CC functional similarities and does not rely on sequence similarities. Prior CC methods only gave limited success for identifying proteins containing an CC Multivalent RU complexes are particularly suited to screening for CC Multivalent RU complexes are particularly suited to screening for CC identical in sequence to, the original target functional domain. The new CC method enables proteins having a common function to be identified. CC identification of novel SH3 proteins will be useful for a better CC understanding of cell growth, malignancy, signal transduction processes, etc. New candidate drugs can be identified, and their specificities (e.g. pharmacological activities) can be assessed using the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              £X&XSSSSSSSSSSSSSSSSSSSSSSSSSS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC AAW05445-W05492 represent Src-homology region 3 (SH2) domain binding CC peptides. These sequences were used as parts of multivalent recognition CC unit complexes used in the method of the invention. The method of the CC invention is for identifying polypeptides containing functional domains of interest (especially SH3 domains). It comprises contacting a CC multivalent recognition unit (RU) complex with a number of peptides and CC identifying polypeptides having a selective binding affinity for the RU complex. The method is based on functional similarities and does not rely CC complex. The method is based on functional similarities and does not rely CC enteritying proteins containing an SH3 domain due to the minimal sequence identifying proteins containing an SH3 domain due to the minimal sequence CC homology among known SH3 proteins. Multivalent RU complexes are CC particularly suited to screening for polypeptides containing functional CC domains that are similar to, but not identical in sequence to, the CC original target functional domain. The new method enables proteins having CC a common function to be identified. Identification of novel SH3 proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Conjugates of the peptides with detectable labels or imaging agents are useful for imaging cells, tissues and organs in which Src or Src-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Src
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     proteins are expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Src; SH3; Src homology region 3; binding affinity; oncogenic protein; protein tyrosine kinase; signal transduction; RNA processing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW11101 standard; peptide; 13
                                                                                                                                       for regulating the processing, trafficking or translation of RNA. Conjugates of the peptides with detectable labels or imaging agen useful for imaging cells, tissues and organs in which Src or Src-
                                                                                                                                                                                                      AAW11098-W11124 are peptides that bind to the Src SH3 domain. The SH3 binding peptides are useful in modulating signal transduction pathways at the cellular level (especially protein tryosine kinase-mediated), modulating oncogenic protein activity, or providing compounds for the development of drugs with the ability to modulate broad classes, as well as specific classes, of proteins involved in signal transduction and also as specific classes, of proteins involved in signal transduction and also
                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide with binding affinity for Src homology region 3 (SH3) domains proteins - useful for e.g. modulating signal transduction pathways at cellular level, esp. protein tyrosine kinase-mediated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22-JUL-1994;

                                                                                           S
                                                                                                                The present sequence represents a Src SH3 synthetic binding peptide. SH3 CC (Src homology region 3) binding peptides are selected from: (a) peptides CC which bind the SH3 domain of Cortactin; (b) peptides which bind the CC middle SH3 domain of Nck; (c) peptides which bind the SH3 domain of Abl; CC (d) peptides which bind the SH3 domain of Abl; CC (d) peptides which bind the SH3 domain of Abl; CC (d) peptides which bind the SH3 domain of ELC gamma; (f) peptides which bind the SH3 domain of CK; (e) peptides which bind the SH3 domain of CK; (h) peptides which bind the SH3 domain of CTs; (e) peptides which bind CC peptides which bind the SH3 domain of CTs; (e) peptides which bind CC the amino-terminal SH3 domain of CTs; (h) peptides which bind CC the amino-terminal SH3 domain of GTs2. The purified binding peptides can CC be used in the method to identify inhibitors of their binding to their CT respective SH3 domains, which could be used to modulate the SH3 CC domain. The peptides can also be used to modulate the SH3 CC domain. The peptides can also be used to activate STC or STC-related CT protein tyrosine kinases, to stimulate the immune response by increasing the production of certain lymphokines, e.g. tumour necrosis factor-alpha CC and interleukin-1, or to deliver a conjugated molecule to certain CC cellular compartments containing STC or STC related proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A Klein S., Strausberg R.;

Submitted (ARR-2004) to the EMBL/GenBank/DDBJ databases.

C. -!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein

C. -!- SIMILARITY: Belongs to the Ser/Thr protein kinase family.
